

Abstract

1
2 A security safe having a housing defining a security enclosure, the housing
3 including an opening into an interior of said enclosure for placing items into, and
4 removing items from, said enclosure. A door mechanism is mounted to the housing for
5 movement between opened and closed positions in relation to said opening, wherein in
6 the closed position the door mechanism precludes access to said interior through said
7 opening. In one version, the housing further includes an aperture for inserting items
8 into said enclosure without moving said door mechanism into the opened position. In
9 another version the aperture is defined in a door of the safe.
